

GUIDELINES FOR SUBMITTING INDIVIDUAL ASSIGNMENTS ON GITLAB

FSA's GitLab: <https://git.fsoft-academy.edu.vn/>

1. Select the correct Assignment project

- Go to your class group on GitLab → *Subgroups and projects*.
- Choose the correct assigned project (e.g., *Assignment 01*).

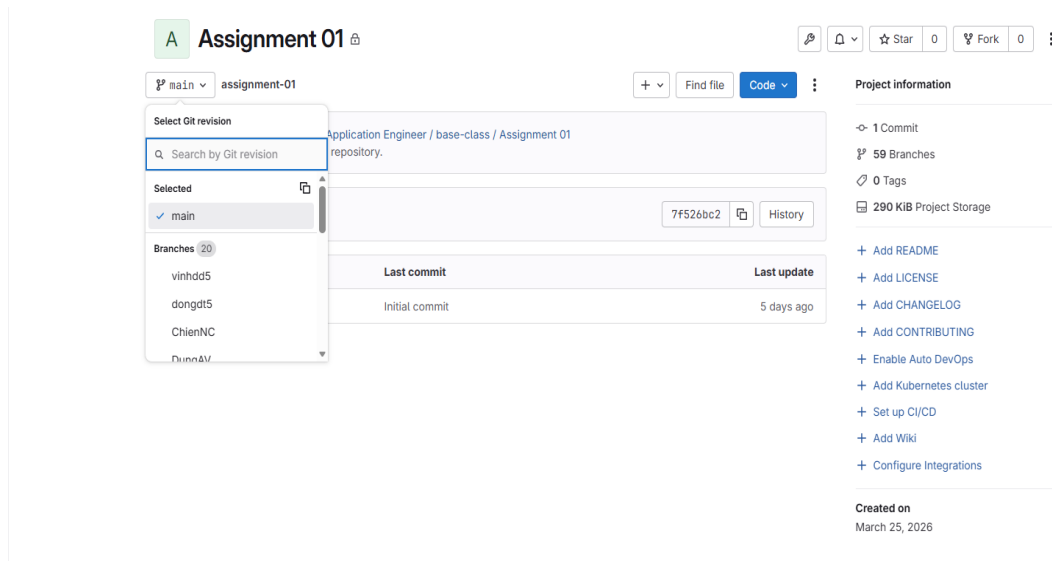

The screenshot shows a GitLab repository page for a project named 'assignment-01'. At the top, it indicates the repository is forked from 'AI Program / AI Application Engineer / base-class / Assignment 01' and is 1 commit ahead of the upstream repository. A 'Create merge request' button is visible. Below this, a commit is shown with the message 'feat: add simple python task manager example' by user 'Kassa' 20 hours ago. A table lists the files in the repository:

Name	Last commit	Last update
glignore	feat: add simple python task manager example	20 hours ago
gitkeep	Initial commit	5 days ago
README.md	feat: add simple python task manager example	20 hours ago
task_manager.py	feat: add simple python task manager example	20 hours ago

Below the table, the 'README.md' file is expanded, showing the title 'Command-Line Task Manager (Python)' and an 'Overview' section. The overview describes the project as a command-line task manager in Python using a list of dictionaries, supporting operations like adding, viewing, marking as completed, and deleting tasks. It also notes that the app uses a predefined command list and does not use `input()`. An 'Approach' section is also visible at the bottom.

2. Work on your personal branch

- Each student has a branch named after their GitLab username (created from main).
- Only commit and push to your own username branch.
- **Do NOT push directly to main.**

3 .Workflow for doing and submitting the assignment

- Clone the correct project
- Do your work in the cloned project
- **Commit changes:** `git add .` → `git commit -m "Short description"`
- **Push to remote:** `git push -u origin your-username`

4. Verify after pushing

- Go to Project → *Repository* → *Commits/Branches*.
- Make sure your commits are on the correct your-username branch.

README.md

Command-Line Task Manager (Python)

Overview

This project implements a command-line task manager in Python using a list of dictionaries. It supports the required operations:

- Add new tasks
- View all tasks
- Mark tasks as completed
- Delete tasks

The app uses a predefined command list (`commands_to_execute`) and does not use `input()`.

Approach

5. Submission checklist

- Correct Assignment project
- Correct personal (username) branch
